

IN THE CLAIMS

1 (Currently Amended). A method comprising:

charging a first glass sheet;
electrostatically adhering said first glass sheet to a second glass sheet;
processing one of said sheets while adhered to the other of said sheets; and
separating said electrostatically adhered sheets.

2 (Original). The method of claim 1 including oppositely charging said second glass sheet.

3 (Original). The method of claim 1 including separating said first and second glass sheets using a fluid flow.

4 (Original). The method of claim 3 including using an ionized air source to discharge said glass sheets.

5 (Original). The method of claim 3 including charging each of said sheets to substantially the same but opposite charge magnitudes.

6 (Original). The method of claim 5 including charging only one side of each sheet.

7 (Original). The method of claim 1 including forming a display panel.

8 (Original). The method of claim 1 including using a corona source to charge said glass sheet.

9 (Original). The method of claim 8 including grounding said glass sheet.

10 (Original). The method of claim 9 including contacting said glass sheet with a ground plate.

11 (Original). The method of claim 9 including grounding a conductive layer on said glass sheet.

12 (Original). The method of claim 1 wherein separating said electrostatically adhered sheets includes progressively peeling said sheets apart.

13 (Original). The method of claim 1 including forming a combined sheet from said first and second sheets that has a thickness compatible with conventional glass processing equipment.

14 (Currently Amended). A method comprising:
forming a composite of two electrostatically adhered glass sheets;
processing one of said sheets while electrostatically adhered to the other of said glass sheets; and
separating said electrostatically adhered sheets.

15 (Original). The method of claim 14 including forming an electronic display.

16 (Original). The method of claim 15 including depositing row and column electrodes on one of said glass sheets.

17 (Original). The method of claim 16 including depositing organic light emitting material on one of said glass sheets.

18 (Original). A method comprising:
electrostatically charging a first glass sheet;
electrostatically adhering the first glass sheet to a second sheet;
forming row and column electrodes on said first glass sheet; and
separating said electrostatically adhered sheets.

19 (Original). The method of claim 18 including forming an organic light emitting material between said row and column electrodes.

20 (Original). The method of claim 19 including depositing a transparent electrically conductive material on said first glass sheet.

21 (Original). The method of claim 18 including charging said first glass sheet and said second sheet to substantially the same but opposite potentials.

22 (Original). The method of claim 21 including adhering said first glass sheet to a second sheet also formed of glass.
